# Model Structure

# Dense Connectivity: *dense* + *concat*

+dense: 모든 layer를 서로 연결!

 : Channel-wise concatenation

# Concatenation!

- **Traditional Convolutional feed-forward networks :**

$$x_l = H_l (x_{l-1})$$

- **ResNets :**

$$x_l = H_l (x_{l-1}) + x_{l-1}$$

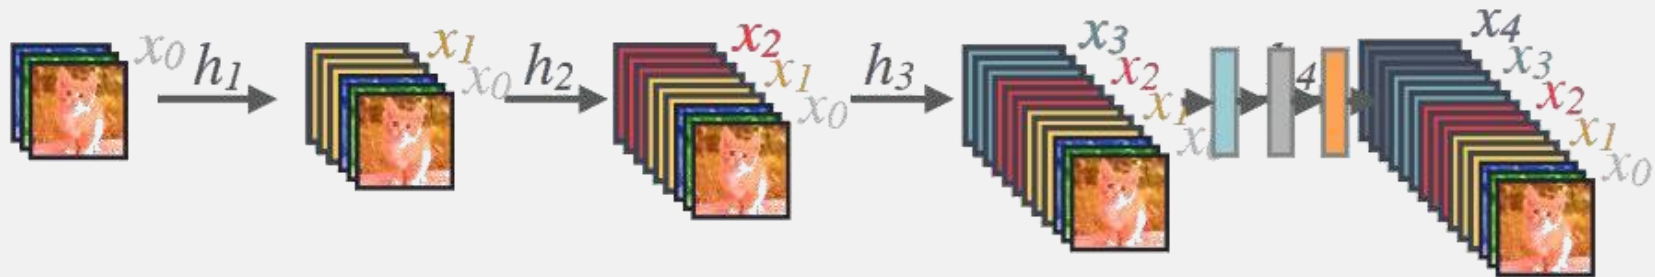

- **DenseNets :**

$$x_l = H_l ([x_0, x_1, \dots, x_{l-1}])$$

Where  $[x_0, x_1, \dots, x_{l-1}]$  refers to the concatenation of the feature-maps produced in layers 0.....  $l-1$ .

# Concatenation!

$k$  : Growth Rate

# Model Structure: Composite layer

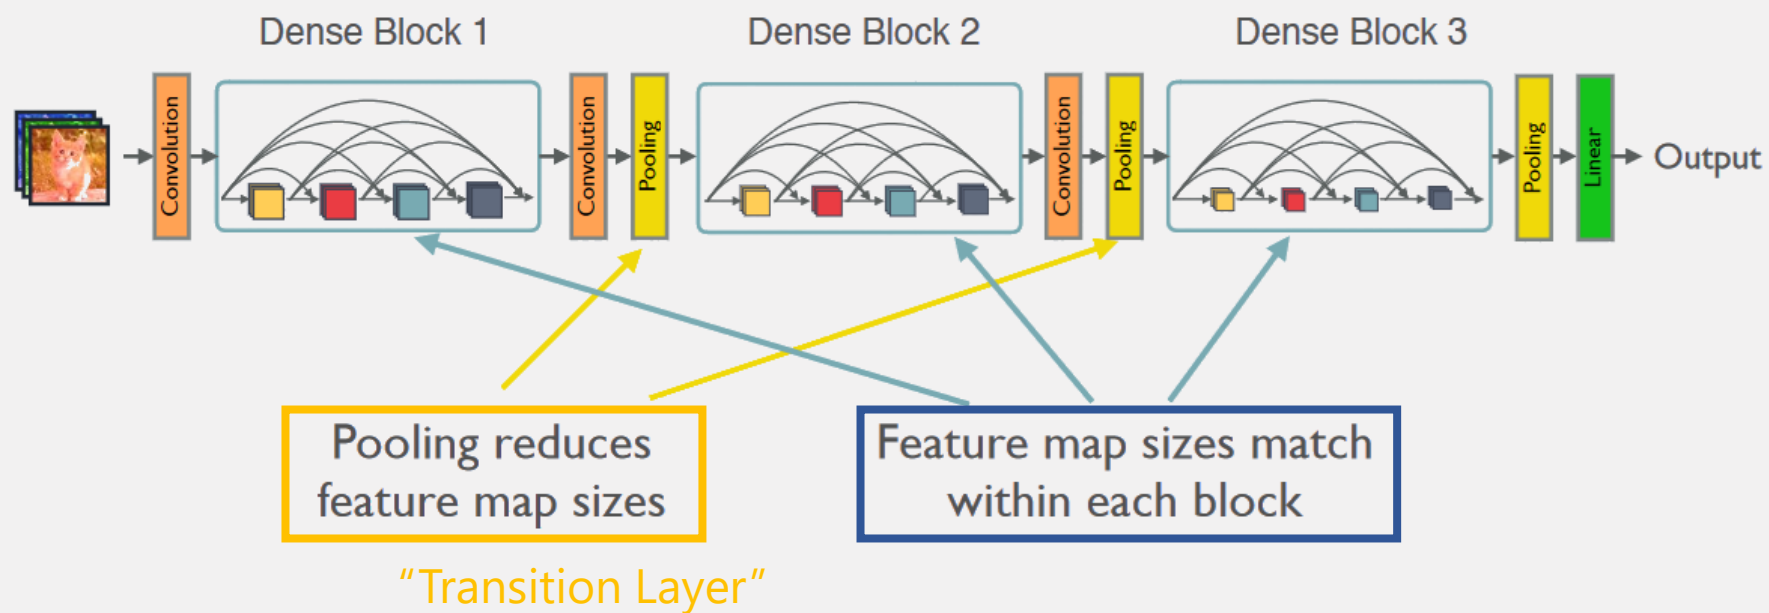

+ Bottleneck layer

$$x_5 = h_5([x_0, \dots, x_4])$$

# Advantages

# 1. Strong gradient flow

- + Backprop: "deep supervision" with single classifier
- + Regularization

## 2. Parameter & computational efficiency

$$O(C \times C)$$

$$k \ll C$$

$$O(l \times k \times k)$$

# 3. Low-level features

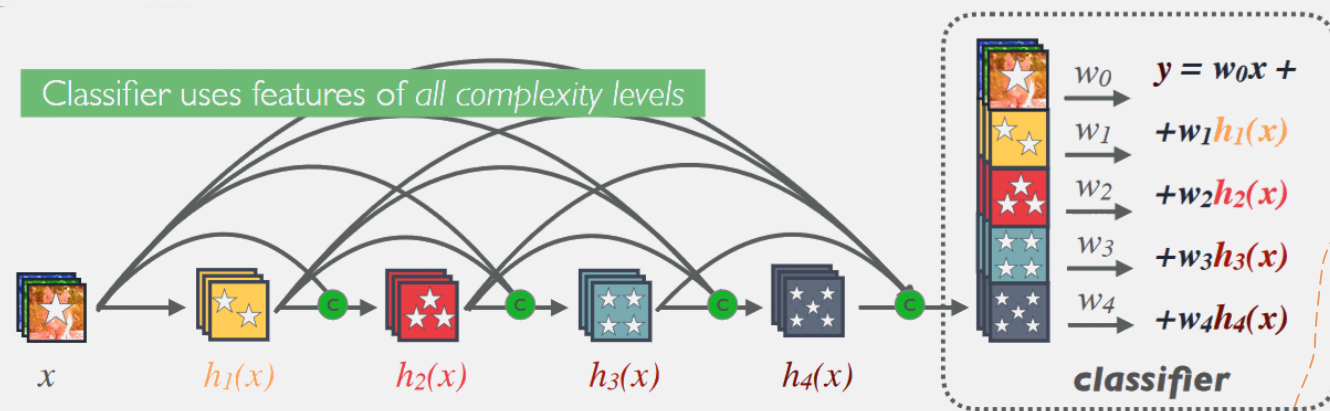

## + Feature Reuse

Classifier uses most complex (high level) features

★ Increasingly complex features →

Classifier uses features of *all* complexity levels

★ Increasingly complex features →

# Low-level features
